Download pgAdmin4

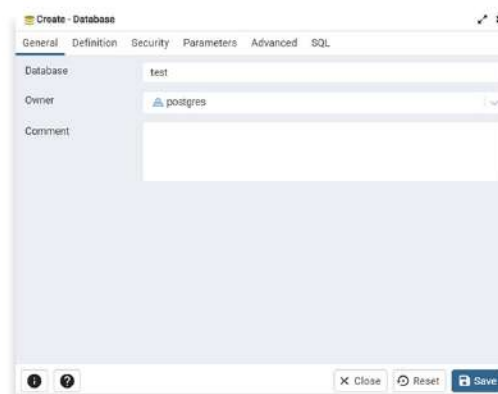

<https://www.pgadmin.org/download/>

Create new database

I create 'test' name database

Here two database postgres and test. we use test database

@_python.py_

03

1. Install psycopg2

run this command - pip install psycopg2

2. Connect with database.

```
import psycopg2      # pip install psycopg2
import psycopg2.extras

host_name = 'localhost'
database = 'test'
username = 'postgres'
pwd = 'root'
port_id = 5432

conn = None

##### Connect with postgresQL database #####

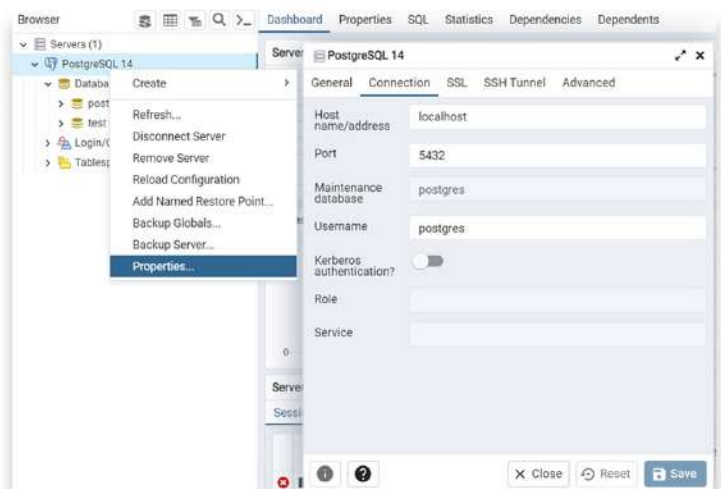

try:
    conn = psycopg2.connect(
        host = host_name,
        database = database,
        user = username,
        password = pwd,
        port = port_id)
    print("Connection Successfully!")

except Exception as error:
    print("Error Message: ", error)

finally:
    if conn is not None:
        conn.close()
```

```
PS F:\PYTHON PROGRAMMING\PostgreSQL_with_python> python main.py
Connection Successfully!
```

to check hostname, port and username
right click + Properties and go
on Connection
password is same as you set
in installation time.

3. Create table.

```
##### Connect with postgresQL database #####

try:
    conn = psycopg2.connect(
        host = host_name,
        database = database,
        user = username,
        password = pwd,
        port = port_id)
    print("Connection Successfully!")

    ##### create table in postgres database #####
    cur = conn.cursor(cursor_factory=psycopg2.extras.DictCursor)
    cur.execute("DROP TABLE IF EXISTS IG_python")
    create_script = '''
        CREATE TABLE IF NOT EXISTS IG_python (
            id int PRIMARY KEY,
            name varchar(100) NOT NULL,
            followers int,
            post_num int
        )
    '''

    cur.execute(create_script)
    conn.commit()

except Exception as error:
    print("Error Message: ", error)
```

for check table in database run select query in pgAdmin

click here for run any query

table

id	name	followers	post_num
----	------	-----------	----------

05

3. Insert data.

```
##### Insert data in IG_python table #####

insert_script = "INSERT INTO IG_python (id, name, followers, post_num) values (%s, %s, %s, %s)"
insert_values = [(1, '@_python.py_', 19100, 210), (2, '_python.py_', 19, 0)]
for insert_value in insert_values:
    cur.execute(insert_script, insert_value)
conn.commit()
```

Note: write code between in try and except

4. Select data.

```
##### Insert data in IG_python table #####

insert_script = "INSERT INTO IG_python (id, name, followers, post_num) values (%s, %s, %s, %s)"
insert_values = [(1, '@_python.py_', 19100, 210), (2, '_python.py_', 19, 0)]
for insert_value in insert_values:
    cur.execute(insert_script, insert_value)

##### Select data from IG_python table #####
cur.execute('SELECT * FROM IG_python')
records = cur.fetchall()
print("Select data is : \n ",)
for record in records:
    print(record)
print()
conn.commit()
```

PS F:\PYTHON PROGRAMMING\PostgreSQL_with_python> python main.py
Connection Successfully!
Select data is :
[1, '@_python.py_', 19100, 210]
[2, '_python.py_', 19, 0]

The screenshot shows a PostgreSQL database browser interface. On the left, the 'Servers' tree is expanded to show the 'test' database. The 'Query Editor' is open, showing the query 'select * from IG_python;'. The 'Data Output' tab is active, displaying the results of the query in a table format.

id	name	followers	post_num
1	@_python.py_	19100	210
2	_python.py_	19	0

5. Update.

```
##### update data in IG_python table #####
update_script = "UPDATE IG_python SET followers = followers * 2"
cur.execute(update_script)
conn.commit()

# select data after update
cur.execute('SELECT * FROM IG_python')
records = cur.fetchall()
print("Select after update data is : ", end="\n")
for record in records:
    print(record)
print()
conn.commit()
```

```
PS F:\PYTHON PROGRAMMING\PostgreSQL_with_python> python main.py
Connection Successfully!
Select after update data is :
[1, '@_python.py_', 38200, 210]
[2, '_python.py_', 38, 0]
```

The screenshot shows a PostgreSQL database browser interface. On the left, the 'test' database is selected under 'PostgreSQL 14'. The 'IG_python' table is highlighted in the 'Databases (2)' section. The 'Query Editor' shows the query 'select * from IG_python;'. The 'Data Output' tab displays the results of the query in a table format.

id	name	followers	post_num
1	@_python.py_	38200	210
2	_python.py_	38	0

6. Delete.

```
##### delete some data from IG_python table #####
delete_script = "DELETE FROM IG_python where name = %s"
delete_id = ('_python.py_', )
cur.execute(delete_script, delete_id)
# select data after delete
cur.execute('SELECT * FROM IG_python')
records = cur.fetchall()
print("Select data after delete : \n ",)
for record in records:
    print(record)
print()
```

```
PS F:\PYTHON PROGRAMMING\PostgreSQL_with_python> python main.py
Connection Successfully!
Select data after delete :
[1, '@_python.py_', 19100, 210]
```

The screenshot shows the PostgreSQL Enterprise Console interface. On the left, the 'Servers' tree is expanded to show the 'test' database. The 'Query Editor' tab is active, displaying the query: `select * from IG_python;`. The 'Data Output' tab shows the results of the query in a table format.

id	name	followers	post_num
1	@_python.py_	38200	210
